Smart Resume Builder with AI Suggestions

Prepared by: Abinaya S (edit if required)

Introduction

A resume is an important document for presenting a candidate’s education, skills and project experience. This project provides a browser-based tool to create and preview a structured resume.

Abstract

The application collects personal details, profile summary, education, skills and project information through a form. JavaScript updates a resume preview instantly and provides rule-based improvement tips. The print layout allows the user to save the resume as a PDF.

Tools Used

HTML5, CSS3, vanilla JavaScript and the browser print-to-PDF feature. No external AI API is configured; suggestions are rule-based.

Steps Involved in Building the Project

1. Created a responsive form for resume information.
2. Designed a professional resume preview beside the form.
3. Used JavaScript input events to update preview content in real time.
4. Added basic checks and improvement suggestions for missing or weak sections.
5. Created print-specific CSS so the preview can be saved as a PDF.

Conclusion

The project demonstrates form handling, DOM manipulation, responsive styling and browser-based PDF export. It provides a simple starting point for building a more advanced resume tool with a real AI service in a future version.
